

4. Import library files

Since some programs require third-party libraries to run properly, here is how to import third-party libraries into Pico 2/Pico. You only need to import the library once, and there is no need to import it multiple times.

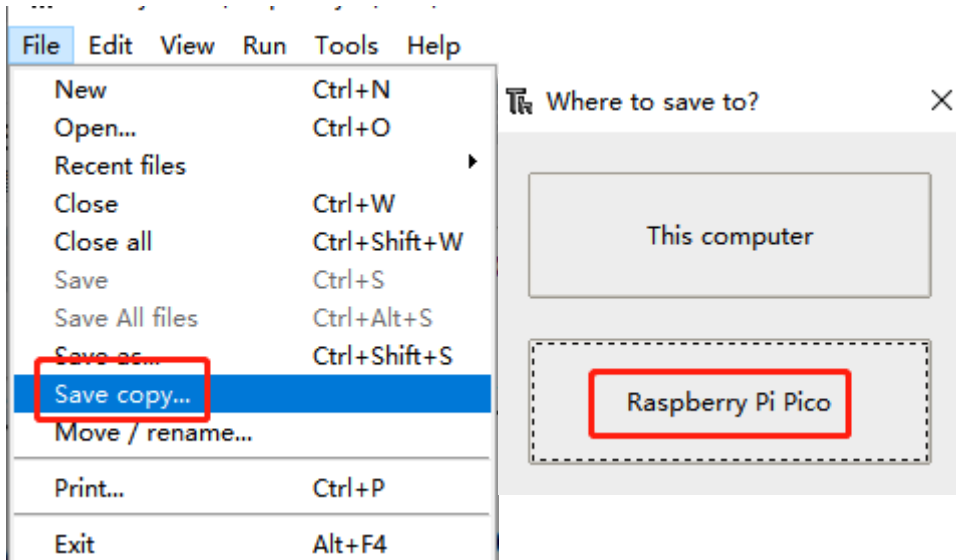

1. First, connect the Pico 2/Pico development board to the computer through the microUSB data cable in the package, open the Thonny IDE software, and click [File]->[Open...]->[This computer]

2. Select the library file in the program summary in the data. Here, take the library of the color recognition module as an example, find the color.py file, and click Open.

3. Click [File]->[Save copy...]->[Raspberry Pi Pico], and enter the saved name as color.py in the lower left corner.

4. Save all libraries one by one to Pico 2/Pico according to the above method. Note that the saved name must be exactly the same as the original name, otherwise an error will occur that the corresponding file cannot be found. The final completion is as shown in the following figure:
